

Accident Investigation

Putting safety first

Reactive monitoring of health and safety performance is an important part of any safety management system and ensures that lessons are learnt from past failures. It is critical for any organisation to evaluate their competence in the area of accident and incident investigation and update their skills accordingly. We've developed two courses that address these issues:

Introduction to Accident Investigation is a one day course aimed at personnel with little or no experience of accident investigation including newly promoted supervisors, junior management and management trainees. It provides a basic understanding of:

- The principles and process involved
- The powers of enforcement authorities
- Accident and incident prevention
- Background to investigations
- Human error

- Underlying causes
- Learning lessons

Advanced Accident Investigation is an optional, additional day that delivers a more advanced programme to delegates who may be asked to lead an internal investigation or those responsible for developing or applying procedures. The training is largely exercise based and covers:

- Defensive health and safety
- The investigation process
- Evidence
- Accident investigation
- Immediate and root causes

We tailor our programmes to suit your organisation's needs and to meet any special circumstances.
